

Data analysis in Docker

1. Write a *Dockerfile*

2. Build an *image*

3. Run a *container*

The darkened building demands

• Large build context can lead to very slow build

You can exclude files and directories from content with a .dckeyignore file

*

!jupyter_notebook_config.py

• docker run creates and runs a container from an image

• Can an image you've built locally or any image on Docker Hub

To run a container from the prebuilt version of our Django Hub:

Make the container interactive
via the terminal

Mount the current working directory
into /mnt in the container

1. Write a Dockerfile

2. Build a *in* magazine

3. *Run a container*

Therapeutic drug monitoring

Bind port 8888 in the container to port 8888 on the host. Allows us to access notebook server in container from browser on host

Assign a name to the container

Specify the image used to run the container

2. Build an *image*

3. *Run a container*
